

HEALTHCARE

PHARMACY AUTOMATION SYSTEMS

Quick and Easy to Use

Mobile Loading Device

This device allows the operator to perform the loading procedures with the best comforts. This device helps the operator with the loading operations providing more comfort in the procedure.

Radio Scanner

The radio scanner reads CIP, EAN 13 and DATAMATRIX codes from considerable distance in order to refill the stock with the maximum efficiency. This saves time while searching for products and entails continuous and fast availability of medicines in the pharmacy.

PC-Assisted Loading

A led indicator system, with a vocal assistance, gives the operator the opportunity to easily find the drawer which necessitates to be refilled. This saves time and minimizes stock errors.

Vertical Select System

This is a moving conveyor belt system characterized by upward and downward movements within the module of the machine. This multi-picking system enables even the most fragile box to be safely controlled. Furthermore, it does not matter where the products are loaded, in every part of the automation.

- Mobile loading device
- Radio scanner
- PC-assisted loading
- Vertical select
- Modular

Modular

The TwinTec with its 1,40 or 2,80 mt. modules is configurable and adaptable (on the same line, on L, on 2 lines...)
